## Swift static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your SWIFT code

All rules 119

 Vulnerability 3

 Bug 14

 Security Hotspot 3

 Code Smell 99

Tags

Search by name...

Hard-coded credentials are security-sensitive

 Security Hotspot

Methods and field names should not be the same or differ only by capitalization

 Code Smell

Cipher algorithms should be robust

 Vulnerability

Using weak hashing algorithms is security-sensitive

 Security Hotspot

Cognitive Complexity of functions should not be too high

 Code Smell

"try!" should not be used

 Code Smell

String literals should not be duplicated

 Code Smell

Functions and closures should not be empty

 Code Smell

Collection elements should not be replaced unconditionally

 Bug

Collection sizes comparisons should make sense

 Bug

All branches in a conditional structure should not have exactly the same implementation

 Bug

Infix operators that end with "=" should update their left operands

 Bug

### Ternary operators should not be nested

Analyze your code

 Code Smell  Major  confusing

Just because you *can* do something, doesn't mean you should, and that's the case with nested ternary operations. Nesting ternary operators results in the kind of code that may seem clear as day when you write it, but six months later will leave maintainers (or worse - future you) scratching their heads and cursing.

Instead, err on the side of clarity, and use another line to express the nested operation as a separate statement.

#### Noncompliant Code Example

```
func getReadableStatus(job: Job) -> String {
    return job.isRunning ? "Running" : job.hasErrors ? "Failed" : "Unknown"
}
```

#### Compliant Solution

```
func getReadableStatus(job: Job) -> String {
    let status: String;
    if (job.isRunning) {
        status = "Running";
    }
    else {
        status = job.hasErrors ? "Failed" : "Succeeded";
    }
    return status;
}
```
