Custom Classes for Data

A Problem With Our Current Approach

ProductViewController.swift

```
import UIKit

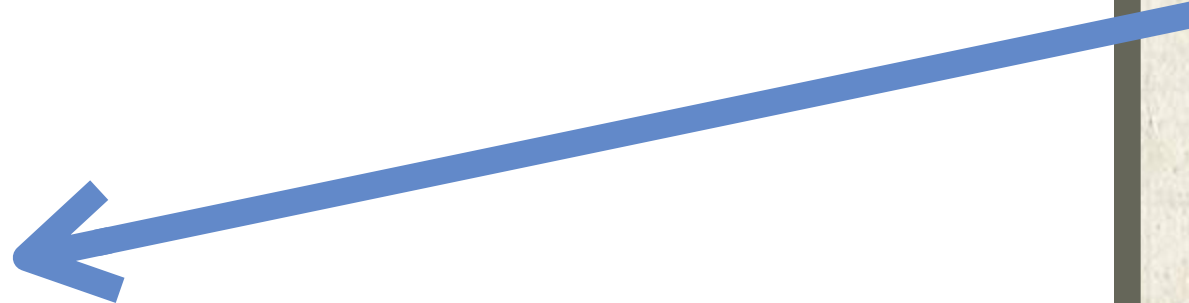

class ProductViewController: UIViewController {

    ...
    var productName: String?

    override func viewDidLoad() {
        super.viewDidLoad()

        ...
        productNameLabel.text = productName
    }
}
```

We can only pass one piece of data

what if we wanted to pass the product and cell images?

One Option for Dealing With Passing Multiple Values

ProductViewController.swift

```
import UIKit

class ProductViewController: UIViewController {

    ...
    var productName: String?
    var cellImageName: String?
    var productImageName: String?

    override func viewDidLoad() {
        super.viewDidLoad()

        ...
        productNameLabel.text = productName
    }
}
```

We could create multiple variables, but there's a better way!

Screencast: Creating a New Class for Data
