Swift static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your SWIFT code

All rules 119 Vulnerability 3 Bug 14 Security Hotspot 3 Code Smell 99

Tags

Search by name...

Hard-coded credentials are security-sensitive

Security Hotspot

Methods and field names should not be the same or differ only by capitalization

Code Smell

Cipher algorithms should be robust

Vulnerability

Using weak hashing algorithms is security-sensitive

Security Hotspot

Cognitive Complexity of functions should not be too high

Code Smell

"try!" should not be used

Code Smell

String literals should not be duplicated

Code Smell

Functions and closures should not be empty

Code Smell

Collection elements should not be replaced unconditionally

Bug

Collection sizes comparisons should make sense

Bug

All branches in a conditional structure should not have exactly the same implementation

Bug

Infix operators that end with "=" should update their left operands

Bug

Precedence and associativity of standard operators should not be changed

Increment (++) and decrement (--) operators should not be used in a method call or mixed with other operators in an expression

Analyze your code

Code Smell Major ?

The use of increment and decrement operators in method calls or in combination with other arithmetic operators is not recommended, because:

- It can significantly impair the readability of the code.
- It introduces additional side effects into a statement, with the potential for undefined behavior.
- It is safer to use these operators in isolation from any other arithmetic operators.

Noncompliant Code Example

```
u8a = ++u8b + u8c--
foo = bar++ / 4
```

Compliant Solution

The following sequence is clearer and therefore safer:

```
++u8b
u8a = u8b + u8c
u8c--
foo = bar / 4
bar++
```
