

CLPlacemark properties

	name	name - if a business or place of interest
	ISOcountryCode	country abbreviation
	country	country
what we want →	postalCode	zip code
	administrativeArea	state
	subAdministrativeArea	county
	locality	city
	subLocality	neighborhood or common name
	thoroughfare	street address
	subThoroughfare	number from street address
	region	CLRegion the placemark appears in

MapViewController.m

```
- (void)getDeviceZip:(id)sender {
    CLGeocoder *geocoder = [[CLGeocoder alloc] init];

    [geocoder reverseGeocodeLocation:self.mapView.userLocation.location
        completionHandler:^(NSArray *placemarks, NSError *error) {
            CLPlacemark *placemark = [placemarks objectAtIndex:0];
            NSString *zipCode = placemark.postalCode;
            // now use that zipCode to make an API request with AFNetworking
        }];
}
```
