Objective C static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your OBJECTIVE C code

Tags

"memset" should not be used to delete sensitive data Vulnerability POSIX functions should not be called with arguments that trigger buffer overflows ■ Vulnerability Function-like macros should not be invoked without all of their arguments 📆 Bug The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist 📆 Bug "pthread_mutex_t" should be unlocked in the reverse order they were locked 📆 Bug "pthread_mutex_t" should be properly initialized and destroyed 📆 Bug "pthread_mutex_t" should not be consecutively locked or unlocked twice 📆 Bug Functions with "noreturn" attribute should not return

be released

📆 Bug

with no padding

"memcmp" should only be called with pointers to trivially copyable types

Stack allocated memory and nonowned memory should not be freed

Closed resources should not be

Dynamically allocated memory should

Functions should not be declared Analyze your code at block scope misra-c++2008 misra-c2004 A function declared at block scope will refer to a member of the enclosing namespace, and so the declaration should be explicitly placed at the namespace Additionally, where a declaration statement could either declare a function or an object, the compiler will choose to declare the function. To avoid potential developer confusion over the meaning of a declaration, functions should not be declared at block scope. **Noncompliant Code Example** class A { }; void fun() { void nestedFun(); // Noncompliant; declares a function in // Noncompliant; declares a function at block s A a(); } See • MISRA C:2004, 8.6 - Functions shall be declared at file scope • MISRA C++:2008, 3-1-2 - Functions shall not be declared at block scope Available In: sonarcloud 🚳 | sonarqube | Developer
