Objective C static code analysis

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your OBJECTIVE C code

Tags

"memset" should not be used to delete sensitive data Vulnerability POSIX functions should not be called with arguments that trigger buffer overflows ■ Vulnerability Function-like macros should not be invoked without all of their arguments 📆 Bug The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist 📆 Bug "pthread_mutex_t" should be unlocked in the reverse order they were locked 📆 Bug "pthread_mutex_t" should be properly initialized and destroyed 📆 Bug "pthread_mutex_t" should not be consecutively locked or unlocked twice 📆 Bug Functions with "noreturn" attribute should not return 📆 Bug

"memcmp" should only be called with pointers to trivially copyable types

Stack allocated memory and nonowned memory should not be freed

Closed resources should not be

Dynamically allocated memory should

with no padding

📆 Bug

📆 Bug

accessed

📆 Bug

be released

```
Unused local variables should be
                                             Analyze your code
removed
unused
If a local variable is declared but not used, it is dead code and should be removed.
Doing so will improve maintainability because developers will not wonder what the
variable is used for.
Noncompliant Code Example
 int numberOfMinutes(int hours) {
    int seconds = 0; // Noncompliant, never used
    return hours * 60;
Compliant Solution
 int numberOfMinutes(int hours) {
    return hours * 60;
Exceptions
No issue is raised on local variables having the attribute "unused" and on object
declarations with non-empty arguments.
