POSIX functions should not be called with arguments that trigger buffer overflows

"memset" should not be used to delete

■ Vulnerability

sensitive data

Vulnerability

Function-like macros should not be invoked without all of their arguments

📆 Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist

📆 Bug

"pthread_mutex_t" should be unlocked in the reverse order they were locked

🖷 Bug

"pthread_mutex_t" should be properly initialized and destroyed

📆 Bug

"pthread_mutex_t" should not be consecutively locked or unlocked twice

📆 Bug

Functions with "noreturn" attribute should not return

📆 Bug

"memcmp" should only be called with pointers to trivially copyable types with no padding

🖷 Bug

Stack allocated memory and nonowned memory should not be freed

📆 Bug

Closed resources should not be accessed

📆 Bug

Dynamically allocated memory should be released

👬 Bug

Null pointers should not be dereferenced

Analyze your code

📆 Bug 🔷 Major 🕝

cwe symbolic-execution cert

A pointer to null (the 0 memory address) should never be dereferenced/accessed. Doing so will at best cause abrupt program termination, without the ability to run any cleanup processes. At worst, it could expose debugging information that would be useful to an attacker or it could allow an attacker to bypass security measures.

Noncompliant Code Example

```
char *p1 = ...;
if (p1 == NULL && *p1 == '\t') { // Noncompliant, p1 will be
}
char *p2 = \dots;
if (p2 != NULL) {
    // ...
*p2 = '\t'; // Noncompliant; potential null-dereference
char *p3, *p4;
p3 = NULL;
// ...
p4 = p3;
*p4 = 'a'; // Noncompliant
```

Compliant Solution

```
char *p1 = \dots;
if (p1 != NULL && *p1 == '\t') { // Compliant, *p1 cannot be
}
char *p2 = \dots;
if (p2 != NULL) {
    // ...
  *p2 = '\t'; // Compliant
```

See

- MITRE, CWE-476 NULL Pointer Dereference
- CERT, EXP34-C. Do not dereference null pointers
- CERT, EXP01-J. Do not use a null in a case where an object is required
