"memset" should not be used to delete sensitive data

Vulnerability

POSIX functions should not be called with arguments that trigger buffer overflows

■ Vulnerability

Function-like macros should not be invoked without all of their arguments

📆 Bug

The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist

📆 Bug

"pthread_mutex_t" should be unlocked in the reverse order they were locked

🖷 Bug

"pthread_mutex_t" should be properly initialized and destroyed

🖷 Bug

"pthread_mutex_t" should not be consecutively locked or unlocked twice

📺 Bug

Functions with "noreturn" attribute should not return

📆 Bug

"memcmp" should only be called with pointers to trivially copyable types with no padding

🖷 Bug

Stack allocated memory and nonowned memory should not be freed

📆 Bug

Closed resources should not be accessed

📆 Bug

Dynamically allocated memory should be released

👬 Bug

Atomic types should be used instead of "volatile" types

Analyze your code

Code Smell

cppcoreguidelines c11 multi-threading cert since-c++11

The main intended use-case for volatile in C and C++ is to access data that can be modified by something external to the program, typically some hardware register. In contrast with other languages that provide a volatile keyword, it does not provide any useful guarantees related to atomicity, memory ordering, or inter-thread synchronization. It is only really needed for the kind of low-level code found in kernels or embedded software, i.e. using memory-mapped I/O registers to manipulate hardware directly.

According to the C standard:

volatile is a hint to the implementation to avoid aggressive optimization involving the object because the value of the object might be changed by means undetectable by an implementation.

Only C11/C++11 "atomic types" are free from data races, and you should use them or synchronization primitives if you want to avoid race conditions.

This rule raises an issue when a local variable or class data member is declared as volatile (at the top level of the type, pointers to volatile are not reported).

Noncompliant Code Example

volatile int counter; // Noncompliant User * volatile vpUser; // Noncompliant; pointer is volatile User volatile * pvUser; // Compliant; User instance is volat

Compliant Solution

atomic_int counter; std::atomic<User*> vpUser; User volatile * pvUser;

See

- CERT CON02-C Do not use volatile as a synchronization primitive
- C++ Core Guidelines CP.200 Use volatile only to talk to non-C++ memory
