## **Objective C static code analysis**

Unique rules to find Bugs, Vulnerabilities, Security Hotspots, and Code Smells in your OBJECTIVE C code

All 315 rules 

Vulnerability 10 

Bug 75 

Security 18 
Hotspot 

Security 18 
Smell 

Quick 13 
Fix

Tags

"memset" should not be used to delete sensitive data Vulnerability POSIX functions should not be called with arguments that trigger buffer overflows ■ Vulnerability Function-like macros should not be invoked without all of their arguments 📆 Bug The address of an automatic object should not be assigned to another object that may persist after the first object has ceased to exist 📆 Bug "pthread\_mutex\_t" should be unlocked in the reverse order they were locked 📆 Bug "pthread\_mutex\_t" should be properly initialized and destroyed 📆 Bug "pthread\_mutex\_t" should not be consecutively locked or unlocked twice 📆 Bug Functions with "noreturn" attribute

should not return

with no padding

"memcmp" should only be called with pointers to trivially copyable types

Stack allocated memory and nonowned memory should not be freed

Closed resources should not be

Dynamically allocated memory should

accessed

📆 Bug

be released

📆 Bug

```
"=+" should not be used instead of
                                               Analyze your code
"+="
🛊 Bug 🔷 Major 🕝
The use of operators pairs (=+) where the reversed, single operator was meant (+=)
will compile and run, but not produce the expected results.
This rule raises an issue when =+, =-, =!, =&, =*, +=+, and -=- are used without any
space between the two operators and when there is at least one whitespace after.
Noncompliant Code Example
 int target = -5;
 int num = 3;
 target =- num; // Noncompliant; target = -3. Is that really
  target =+ num; // Noncompliant; target = 3
Compliant Solution
 int target = -5;
 int num = 3;
 target = -num; // Compliant; intent to assign inverse value
 target += num;
